

One system to schedule, dispatch, and document every inspection and test holdpoint, from request to sign-off.

elas QC Holdpoint is the coordination layer a quality team runs every field inspection and test holdpoint from. On a large project, tens of thousands of inspections run across many parties, internal QC, third-party testing, the engineer of record, and the authority having jurisdiction, on calendars, texts, and spreadsheets that break. A missed or mistimed holdpoint means idle crews, wasted inspector trips, re-inspection, and a record that falls apart at closeout. QC Holdpoint puts it in one place: schedule it, route it to the right party, capture the result with evidence, and sign off so work keeps moving. For owners, that means live visibility into inspection status and a complete, verifiable record at handover.

How it works

The inspection lifecycle for a single holdpoint. Auto-routing sends each request to the party that owns the inspection type; the trade is notified of every outcome by SMS and email.

What you get

- **One live view of every inspection** across all sites and trades, with clear status: requested, scheduled, passed, failed, overdue.
- **Auto-routing and notifications.** Each request goes to the party that owns it, with email and SMS alerts and a full sent log.
- **Roles and scoped permissions.** Every party sees only what it should, with notice-period rules (for example 48 hours for an AHJ) enforced.
- **Results captured on site.** Pass/fail, photos, observations, and plan markups pinned to the exact location, at the point of inspection.
- **First-time vs re-inspection tracking.** Spot repeat failures by trade or type early, before they turn into rework.
- **Reports and handover.** A PDF report for every holdpoint and a complete handover package built continuously, ready at closeout.
- **Exceptions-first views** for managers, so you manage by what is missing, not by scrolling a list.

Fits your systems

QC Holdpoint complements your commissioning or QA system of record, it does not replace it. When a holdpoint passes, the completed inspection pushes out as a PDF or into your live checklist. Issues and punch lists stay in your system of record, so safety-critical items live in one place.

Security & data

Hosted on US-based AWS. SOC 2 Type I attested; report available under NDA. Your data is exportable in full at any time and can be permanently deleted at project end. External parties log in through secure per-user links, with no shared passwords.

About elas

elas was founded by a professional engineer with 30 years in the field, and the platform grew out of the special-inspections world, built by the people who run inspections for a living rather than generic construction software adapted after the fact. That heritage is why QC Holdpoint speaks a quality team's language, inspection types, holdpoints, ITPs, and sign-offs, from day one.
